III. INTERESTS – CLINICAL, RESEARCH AND ADVOCACY

My clinical work focuses on the use of multimodal and customized treatments for the treatment of osteoarthritis and joint pain. I also specialize in the rehabilitation of joint replacement patients, with a focus on patients with persistent pain or impaired outcome. I care for joint replacement patients across the spectrum of locations – before surgery, during their hospital recovery, in rehabilitation facilities, and in the office. My clinical experience has led me to investigate why certain patients do poorly after knee replacement, and in particular how depression, anxiety and perception of self influence short and long term outcomes. I have worked with governmental and academic institutions to define and propose standard rehabilitation protocols before and after joint replacement, as a method to help prevent poor outcome. I also am interested in the use of office based local therapies – such as injectable agents (hyaluronic acid, platelet rich plasma therapy, and others) – as a way to improve osteoarthritis outcomes. I believe osteoarthritis is a chronic disease, and the most efficient osteoarthritis care requires the application of disease management tools. I teach medical students and residents the office-based diagnosis and management of arthritis patients, helping them understand customized, multimodal therapies, and instructing them in proper injection techniques. Last, through the clinical and educational outreach of Operation Walk Chicago, I am able to pursue bringing joint replacement surgery and rehabilitation to needy patients in developing countries and the United States. Our focus on international education and program development helps insure our contributions will have a meaningful, sustainable

Victoria Anne Brander MD

effect. In Chicago, we are partnering with clinical and academic institutions and industry to develop a ongoing method to deliver low cost joint replacement surgery for the under- and uninsured.
